                                                                                                                                                                                                                                                         The invention relates to synthetic ribozyme capable of selectively targeting the androgen receptor mRNA. Also included are a gene encoding the synthetic ribozyme, a vector comprising the gene (where expression of the gene in a human prostatic cancer cell is capable of inhibiting androgen receptor activation), reducing androgen receptor activity in an animal having prostatic hyperplasia by administering a preparation comprising the vector, and treating prostatic hyperplasia by administering to the patient a formulation of an active preparation of a ribozyme gene construct comprising a human promoter sequence in a vector carrier (where the ribozyme gene construct comprises a ribozyme gene that provides an expression product capable of selectively reducing androgen receptor activation). The synthetic ribozyme is capable of selectively reducing of an activation of a receptor activation). The synthetic ribozyme is capable of selectively reducing androgen receptor mRNA and can be used in the inactivation of a receptor gene construction and for treating prostatic hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                treating prostate hyperplasia or cancer, and other androgen dependent pathologies. This sequence represents a primer used to detect express of hammerhead ribozyme HR2 in cultured cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New synthetic ribozyme capable of selectively targeting androgen receptor mRNA, useful in inactivating androgen receptor gene expression, and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        08-MAY-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAV80302 and AAV80303 represent primers specific for CC glucocorricoid -induced leucine-zipper family related (GILR) protein CC encoding cDNA. These were used for constructing a probe for the RNase CC protection analysis (RPA). The GILR protein, isoforms, fragments or CC analogues of the protein are capable of inhibiting apoptosis and CC stimulating lymphocyte activity. Eukaryotic or prokaryotic host cells can be used to produce the protein recombinantly. The mouse CC mucleic acid can be used to produce the protein recombinantly. The mouse CC and human GILR proteins, isoforms, analogues, fragments or derivatives or CC inhibition of apoptosis in cells mediated by the Fast-Igand system, CDJ/T CC cell receptor (TCR) system or other intracellular mediators of apoptosis. CC diseases, graft rejection, diabetes, multiple sclerosis, AIDS or CC can be used for treating inflammation, acute hepatitis, autoimmune CC immunodeficiencies. Inhibition of the activity of GILR proteins in cells for the treatment of tumour cells or HIV-infected cells or other diseased CC cells. The products can also be used for detection and diagnostic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

CC Human VR1 is preferentially expressed in human dorsal root ganglia (DRG) CC and relative to hVR3 has the highest sequence homology with the rat VR1. CC The hVR3 gene maps to chromosome 12 near markers D12S177E and D12S1893. CC hVR1 is activated by capsaicin, the irritant in hot peppers. VRs are CC back to pain-processing centres in the central nervous system. They are CC also sites for the release of pro-inflammatory mediators in the CC periphery. Capsaicin induces a flux of cations in DRG. The actions of CC capsaicin (excitation/desensitisation) are mediated by VRs. The natural CC hVR sub-types may provide targets for the development of novel analgesic CC agents and agents which may interact with other disorders. hVR is useful CC of hVR activity, e.g. pain, neuropathic pain, inflammatory pain, chronic CC meuralgia, algesia, neurodegeneration, nerve injury, stroke, ischaemia, CC chronic obstructive pulmonary disease (COPD), urological disorder, asthma, CC chronic obstructive pulmonary disease (COPD), urological disorder, asthma, CC disorder in a human patient (claimed)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the equine laminin gamma-2 polypeptide and the polynucleotide encoding it. The invention also relates to a method for diagnosing junctional epidermolysis bullosa (JEB) in a horse, comprising obtaining a biological sample from the horse, isolating DNA and amplifying the DNA encoding laminin gamma-2 using appropriate primers and analysing the amplified nucleic acid to identify the presence of a mutation, where the homozygous presence of the mutated nucleic acid encoding laminin gamma-2 indicates the presence of epidermolysis bullosa. Alternatively, the protein component from the sample can be isolated and screened for laminin gamma-2, where the absence of laminin gamma-2 nucleic acids, proteins and antibodies against the proteins are useful for diagnosing JEB in horses. This sequence represents a PCR primer used to amplify cDNA encoding equine laminin gamma-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated equine laminin polynucleotide, useful for c

Also described: (1) a similar method for component contained in a food, or for identifying a component contained in a food, or for identifying a component contained in a food, or for identifying a component contained in a food, or for identifying a component contained in a food, or for identifying a component consumer of such substance by performing component of a gene of the specific substance; (2) primers for PCR applicable in food testing which are designed on the basis of data obtained from a component of a gene of the specific substance; (2) primers for PCR applicable in food substance; and (3) kits for determining components or identifying specific harmful allergens in (processed) trace components or identifying specific harmful allergens in (processed) foods, particularly applicable in food safety and management. The present sequine represents a PCR primer for a Fagopyrum esculentum major callergenic storage protein designated PAGAGI, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC capability of a mammalian cell involving collecting a drug transport CC capability of a mammalian cell involving collecting a sample from a CC gene or a polymorphism of the amino acid sequence of ABCG2 polypoptide. CC mammalian cell. Polymuclectides comprising gingle nucleotide companies of the method is useful for predicting drug transport capability of a CC polymorphism of the amino acid sequence of ABCG2 polypoptide. CC mammalian cell. Polymuclectides comprising polymorphic mutations of the CC polypoptides or polypoptides comprising pingle nucleotide or polymorphisms or polypoptides comprising polymorphic mutations of the CC polypoptides, where the subject having the polymuclectides or CC polypoptide is suggested to be sensitive to the indolocarbozole compound. CC measuring drug transport capability. By predicting drug transport capability by protein mutant is useful for CC apability of a mammalian cell, sensitivity of a patient to various drugs can be obtained. As a result of selecting an anti-cancer drugs can be diagnosed and an indicator for the CC cancer therapy and, particularly, detecting a cancer cell(s) which is cellectively apply the compounds for the therapy. In addition, the optimum compounds is reduced whereby a provided. This sequence represents a primer used to identify ans sequence compounds is reduced whereby a provided. This sequence represents a primer used to identify ans sequence compounds is a provided. This sequence represents a primer used to identify ans sequence compounds is compounds in the cancer charapy in sequence capability and the indolocarbozole compounds is reduced whereby and compounds is compounds is sequence represents a primer used to identify ans sequence cancer therapy and the indolocarbozole compounds is compounds is compounded in the cancer therapy and the compounds is compounded in the cancer therapy and the compounds is compounded in the cancer therapy and the compounds is compounded in the cancer therapy and the compounds is compounded to identify and sequence c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The invention relates to a new compound 8-80 nucleobases in length (an antisense oligonucleotide) targeted to a nucleic acid molecule encoding forkhead box C2, where the compound specifically hybridises with the nucleic acid molecule encoding human forkhead box C2 appearing as ADN31339 and inhibits the expression of forkhead box C2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a polynucleotide isolated from a gene and is useful for detecting a single nucleotide polymorphism human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    12-AUG-2004 (first entry)

The compound and methods are useful in diagnosing and treating developmental disorders e.g. lympoedemas such as lympoedema-distichiasis, dysgeneses of the mouse iridocorneal angle similar to those seen in human Axenfeld-Rieger anomaly and congenital glaucoma. The present sequence is an antisense oligonucleotide targeting forkhead box
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

They are also useful in research and diagnostics for modulating the expression of CD24. The present sequence represents a human CD24 antisense oligonucleotide of the invention.

                                                                                                      Ş
                                                                                                                                                                                                                                                    This sequence represents a primer used to isolate the grapevine leafroll C virus (GLRaV-5) DNA sequence of the invention. The DNA sequence can be used in an expression construct. The construct is useful for providing c resistance to GLRaV infection in a recombinant plant cell by transforming the plant cell with it, where transcription of the polynucleotide sequence interferes with a normal viral function such as movement, c encapsidation or replication of viral RNA. The polynucleotide sequence is expressed as an antisense sequence and encodes a GLRaV coat protein, c preferably a defective GLRaV coat protein or a GLRaV coat protein. The GLRaV-5 DNA is useful for the synthesis of GLRaV, as c diagnostics and probes, for viral gene mapping and for induced plant GL disease resistance. It is also useful to detect and quantitate expression of GLRaV in plant tissue prior to use in vegetative propagation, by detecting the presence of GLRAV RNA. (Updated on 06-AUG-2003 to correct of GLRAV in plant tissue prior to use in vegetative propagation, by GLRAV in plant tissue prior to use in vegetative propagation.

The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwn22 (gil 4732114 |gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

This sequence has been recovered from the left border of the T-DNA.

It indicates an insertion close to or within gene At5g22840.

Details on the protocols used for generation of the sequence are
described in References 1-3. The sequences are generated at the MpI
for Plant Breeding Research in the context of the GABI-Kat project.

GABI-Kat is part of the German Plant Genomics program designated
                                                                                                                                                                                                                                                                                                                                                                                       High-throughput generation of sequence indexes from T-DNA mutagenized Arabidopsis thaliana lines BioTechniques 35 (6), 1164-1168 (2003)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   BX894771.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BX894771
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Similarity
                                                                                                                                                                                                                                                                                                                                                     (bases 1 to 74)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Y., Rosso,M.G., Strizhov,N., Viehoever,P. and Weisshaar,B. I-Kat SimpleSearch: a flanking sequence tag (FST) database identification of T-DNA insertion mutants in Arabidopsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of public (31/4732114/gb/AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conservative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note=PCR was performed on DNA from Arabidopsis thaliana plants (T1) which were transformed with the T-DNA from vector pAC161 (GenBank accession number: AJ537514). The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Biomedical Polymers Research Bldg., 20 S. 2030
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      T-DNA derived sequences were removed."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /db_xref="taxon:3702"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWNA2 (gi|4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

Constructed at the Institute for Genomic Research (TIGR),
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma bruced (TREU927/4 GUTat 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + 1 method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwmb2 (gil4732114/gb)AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AZ818778.1 GI:12988686
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (bases 1 to 42)
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative funducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               308,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Conservative
                                                                          was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Conservative
                                                                                                                                     Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pND42 (gi|4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
with adaptors complementary to the insert adaptors and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       USA

/note="Vector: psport1; Site_1: Not1; Site_2: Sal1; The cDNA library was constructed from mRNA isolated from immature pods (approximately 2cm long) of greenhouse grown plants. The library was prepared using the Life Technologies psuperscript cDNA library construction kit. Complementary DNA was synthesized from mRNA using a poly(dT) sequence with a NotI restrictions site. Sal1 linkers adapters were ligated to the blunt-ended cDNA fragments followed by NotI digestion. The cDNA fragments site of the psport1 vector. The ligated cDNA fragments site of the psport1 vector. The ligated cDNA fragments site of the psport1 vector. The ligated cDNA fragments site of the psport1 vector. The ligated cDNA fragments were transformed into E.col1 ElectroMax DH10B host cells. This library was constructed in the laboratory of Dr. Lila Vockin by Anu Khanna at the University of Illinios at Urbana-Champaign. email: 1-vodkin@uiuc.edu"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /clone="GENOME SYSTEMS CLONE ID: Gm-c1071-719"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative inducible derivative of plasmid R1. The vector was ligated purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Laboratory Nouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were adaptored DNA was purified and size-selected for a 9.5 to electrophoresis. Vector DNA was prepared from a derivative of pwass (gil4732114/gb/RF129072.1), a copy-number inductible derivative of plasmid R1. The vector was ligated burified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        801 585 5606

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /lab host="E. coli strain XL10-Gold, T1-resistant, F./clone lib="Mouse 10kb plasmid UUGC2M library" /note="Vector: PWD42nv; Purified genomic DNA from M.musculus C578L/6J (female) was obtained from the Jaboratory Mouse DNA Resource
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid RI. The vector was ligated with adaptors complementary to the insert adaptors and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnarsey). The DNA was hydrodynamically sheared by repeated passes through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sex="Female"

                                                                                                                                                                                                                                                                                                                                                                                                                          CCACTCCCATT 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwp42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Laboratory Mouse DNA Resources documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative inducible derivative of plasmid R1. The vector was ligated purified. The sheared, adaptored DNA was annealed to the blunt ends in high molar excess. The 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative inducible derivative of plasmid R1. The vector was ligated purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    musculus CSTBL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were adaptored DNA was purified and size-selected for a 9.5 to electrophoresis. Vector DNA was prepared from a derivative of pwhores gel electrophoresis. Vector DNA was prepared from a derivative inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and adaptored vector DNA, and transformed DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Coli strain XL10-Gold, T1-resistant, F-"
/clone lib="Mouse 10kb plasmid UUGCIM library"
/note="Vector: PMD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.05 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWB42 (gil4732114|gb)AF129072.ll, a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

(Stratagene); Site 1: XhoII; Site 2: EcoRI; CDNA oligo
dT-primed [5'-(GA)I0-ACTAGTCTCGAGTTTTTTTTTTTTTTTTT']') and
directionally cloned using 5' linkers 5'-AATTCGGCACGAG-3'
and 5'-CTCGTGCCG-3'. Size selection of *400bp material
gives average insert size ranging from 1-2 kb. Library was
mass excised (from lambda-UniZAP-XR) and resulting
single-stranded phagemids were prepped and tranformed
into DH10B. Library contains 98.5% recombinants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               USA

Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
